                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /note="Vector: pBluescript SK(-); Site_1: EcoRI; Site_2:
XhoI; Morex (mla) plants were greenhouse grown in the R
Wise lab at Iowa State University, Ames, IA; day old
green seedlings were infected with isolate 5874 of
Blumeria gramminis [. sp. hordel, and leaves were harvested
24, 48 and 72 hr post-inoculation and snap frozen (Wise).
In the TJ Close lab at the University of California,
Riverside, total RNA was prepared from each sample pool,
equal quantities of all three RNA pools were combined,
poly(A) RNA was purified from the mixture, one primary
unamplified cDNA library was made, and I million pfu were
in vivo excised to give pBluescript SK(-) cDNA pagemids
(Chin). Phagemids were plated and picked at the Clemson
University Genomics Institute (CUGI) (Begum, Palmer,
Frisch, Atkins and Wing). Plasmid'DNA preparations, DNA
sequencing and sequence analysis were performed at CUGI
(Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main).
The sequence has been trimmed to remove vector sequence
and contains a minimum of 100 bases of phred value 20 or

/note="Organ: Anthracnose-infected leaves from
two-week-old sorghum plants 48 hr after inoculation;
two-week-old sorghum plants 48 hr after inoculation;
Vector: pBluescript II from Lambda Zap II; Site 1: XhoI;
Site_2: EcoRI; Two-week-old sorghum plants (BTX 63)
Cullivar) were infected with pathogen (isolate FRW421 of
Culletotrichum graminicola, which is a sorghum isolate).
RNA was prepared from infected leaves harvested from 45
seedlings (2 weeks old) exhibit juvenile resistant
reaction, which is an incompatible interaction. As they
grow older (4 weeks or older), plants resume susceptiblity
to anthracnose disease. The library was made from poly-A
RNA in the cloning vector lambda ZAP II. Clones to be
sequenced were prepared by mass excision. WARNING: while
most or all ESTs are expected to derive from the host
plant, ho effort was made to eliminate ESTs deriving from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   530 bp mRNA linear EST 15-JUL-1999

// Morex (mla) plants were greenhouse grown in the R Wise lab at Iowa State University, Ames, IA; T day old green seedlings were infected with isolate 5874 of Blumeria graminis f. sp. hordei, and leaves were harvested 24, 48 and 72 hr post-incoulation and snap frozen (Wise). In the TJ Close lab at the University of California, Riverside, total RNA was prepared from each sample pool, equal quantities of all three RNA pools were combined, poly(A) RNA was purified from the mixture, one primary unamplified cDNA library was made, and 1 million pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids (Chin). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequence and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or

* (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

* NOTE: This is a 'working draft' sequence. It currently

* Consists of 56 contigs. The true order of the pieces

* is not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* runs of N. but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will

* be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    * NOTE: This record contains 79 individual

* sequencing reads that have not been assembled into

* contigs. Runs of N are used to separate the reads

* and the order in which they appear is completely

* arbitrary. Low-pass sequence sampling is useful

* identifying clones that may be gene-rich and allows

* overlap relationships among clones to be deduced.

* However, it should not be assumed that this clone

* will be sequenced to completion. In the event that

* the record is updated, the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Contact: sequence_submissions@genome.wi.mit.edu

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Genes were identified by a combination of several methods: Gene prediction programs including Fgenesh (http://www.softberry.com/), genscan and Genescan+ (Chris Burge, http://www.softberry.com/), http://CCR-081.mft.edu/GENSGAN.html), GeneMarkHMM (Mark Borodovsky, http://GCR-081.mft.edu/GENSGAN.html), GeneMarkHMM (Mark Borodovsky, http://genemark.biology.gatech.edu/GeneMark), and GeneSplicer (Mihaela Pertea and Steven Salzberg, contact mpertea@tig.org), searches of Esteven Salzberg, contact mpertea@tig.org, searches of the plant EST database at TGR (http://www.tigr.org/tdb/tg1.shtml). Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity are named as unknown proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their length are annotated as hypothetical proteins. Genes encoding tRNAs are identified by repeatmasker (Arian Smit, http://ftp.genome.wustl.edu/eddy/tRNAscan-SE/). Simple repeats are identified by repeatmasker (Arian Smit, This BAC overlaps with rice BAC OSINBAOOT8001 (ACO92489) and OSINBAOOT8001 (ACO92489).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /clone="05JNBa0017E08"

NOTE: This is a "working draft' sequence. It currently consists of 94 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Direct Submission

NOTE: This is a "working draft" sequence. It currently consists of 70 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

* NOTE: Estimated insert size may differ from sequence length

* (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

* NOTE: This is a 'working draft' sequence. It currently

* consists of 84 contigs. The true order of the pieces

* consists of 84 contigs. The true order of the pieces

* is not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* runs of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will

* be preserved.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and its derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Description

                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                               The present invention describes an improvement to a method requiring the administration of interferon alpha (IFN-alpha), involving administering an immunostimulatory nucleic acid (ISNA). The sequences of a number of such nucleic acids are also provided. These may comprise oligonucleotides with phosphorothioate backbones, palindromes, or G-rich sequences. The sequences of the invention are useful in the treatment of proliferative diseases, such as cancers, and viral infections. The present sequence is an example of an immunostimulatory oligonucleotide.

The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. toxoplasma, haemophilus, campylobacter, clostraidium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells.

Note: the present sequence may have a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immunostimulatory nucleic acids can be primitate an nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (pyrich) or thymidine (T) rich. The method is used to vaccinate subjects and/or orthomyxoviridae), viral antigens (e.g. herpesviridae, retroviridae) haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a
                                  administration of interferon alpha (IFN-alpha), involving administering and inmunostimulatory nucleic acid (ISNA). The sequences of a number of such nucleic acids are also provided. These may comprise oligonuclectides with phosphorothioate backbones, palindromes, or G-rich sequences. The sequences of the invention are useful in the treatment of proliferative diseases, such as cancers, and viral infections. The present sequence is an example of an immunostimulatory oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Vaccine, cytostatic; virucidal; bactericidal; fungicidal; anti-parasitic; munuostimulatory; tumour; viral infection; bacterial infection; fungal infection; cancer; asthma; infection; parasitic infection; cancer; asthma; infectious disease; allergy; immune deficiency; phosphorothioate; ss.
                    present invention describes an improvement to a method requiring: the

```
administration of interferon alpha (IFN-alpha), involving administering and inmunostimulatory nucleic acid (ISNA). The sequences of a number of such nucleic acids are also provided. These may comprise oligonuclectides with phosphorothioate backbones, palindromes, or G-rich sequences. The sequences of the invention are useful in the treatment of proliferative diseases, such as cancers, and viral infections. The present sequence is an example of an immunostimulatory oligonucleotide.
                                                                                                                                                                                                                         Immunostimulatory nucleic acid; ISNA; human; interferon alpha; IFN-alpha;
viral infection; phosphorothioate backbone; palindrome; cancer; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes an improvement to a method requiring the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine (r) prich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or

The sequences of a number of such nucleic acids are also provided. These may comprise oligonucleotides with phosphorothicate backbones, palindromes, or G-rich sequences. The sequences of the invention are useful in the treatment of proliferative diseases, such as cancers, and viral infections. The present sequence is an example of an immunostimulatory oligonucleotide.

The present invention describes an improvement to a method requiring the administration of interferon alpha (IFN-alpha), involving administering an immunostimulatory nucleic acid (ISNA). The sequences of a number of such nucleic acids are also provided. These may comprise oligonuclectides with phosphorothioate backbones, palindromes, or G-rich sequences. The sequences of the invention are useful in the treatment of proliferative diseases, such as cancers, and viral infections. The present sequence is an example of an immunostimulatory oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Immunostimulatory nucleic acid; ISNA; human; interferon alpha; IFN-alpha; viral infection; phosphorothioate backbone; palindrome; cancer; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acids. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. iherpesviridae, retroviridae) haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for presenting cancer, asthma, infectious disease, allergy, or immune deficiency. The present sequence can also be used to redirect a thi immune response and to activate immune cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

The present invention describes an improvement to a method requiring the administration of interferon alpha (IFN-alpha), involving administering an immunostimulatory nucleic acid (ISNA). The sequences of a number of such nucleic acids are also provided. These may comprise oligonucleotides with phosphorothioate backbones, palindromes, or G-rich sequences. The agequences of the invention are useful in the treatment of proliferative diseases, such as cancers, and viral infections. The present sequence is an example of an immunostimulatory oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Immunostimulatory nucleic acid; ISNA; human; interferon alpha; IFN-alpha; viral infection; phosphorothioate backbone; palindrome; cancer; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes an improvement to a method requiring the
 interferon-alpha by co-administering an isolated immunostimulatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Improving the efficacy of treatments involving the administration (interferon-alpha by co-administering an isolated immunostimulatory nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Immunostimulatory nucleic acid assay control oligo SEQ ID NO: 160

                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                     administration of interferon alpha (IFN-alpha), involving administering an immunostimulatory nucleic acid (ISNA). The sequences of a number of such nucleic acids are also provided. These may comprise oligonucleotides with phosphorothicate backbones, palindromes, or G-rich sequences. The sequences of the invention are useful in the treatment of proliferative diseases, such as cancers, and viral infections. The present sequence is an example of an immunostimulatory oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Immunostimulatory nucleic acid; ISNA; human; interferon alpha; IFN-alpha;

The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulatory nucleic acid to a non-rodent sequence is one such immunostimulatory nucleic acids can be pyrimidine rich (pyrtich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/dr orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasiticiantigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or
                                                                                                                                                                                                                                                          ó
                an immunostimulatory nucleic acid (ISNA). The sequences of a number of such nucleic acids are also provided. These may comprise oligonucleotides with phosphorothicate backbones, palindromes, for G-rich sequences. The sequences of the invention are useful in the treatment of proliferative diseases, such as cancers, and viral infections. The present sequence is an example of an immunostimulatory oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Vaccine, cytostatic; virucidal; bactericidal; fungicidal; anti-parasitic; immunostimulatory; tumour; viral infection; bacterial infection; fungal infection; parasitic infection; cancer; asthma; infectious disease; allergy; immune deficiency; phosphorothioate; ss.
administration of interferon alpha (IFN-alpha), involving administering

The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immunoe response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Thi immune response and to activate immune cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immuno stimulate an immuno stimulatory. The present sequence is one such immunostimulatory, nucleic acid. The immunostimulatory in nucleic acid. The immunostimulatory in method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. toxoplasma, retroviridae) haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a limmune acidiciency. The present sequence can also be used to redirect a fine the present sequence may have a phosphorothicate backbone.

XhoI: Plants were grown at Washington State University,
Ellants were grown at Washington State University,
Pullman, WA in a greenhouse, the rachises were excised and
frozen in liquid nitrogen (Rieinhofs lab). In the TJ Close
lab at the University of California, Riverside total RNA
was prepared, poly(A) was purified; one primary
unamplified cDNA library was made, and 1 million pfu were
in vivo excised to give pBluescript SK(-) cDNA phagemids
(Chin). Phagemids were plated and picked at the Clemson
University Genomics Institute (CUGI) (Begum, Palmer,
Frisch, Atkins and Wing). Plasmid DNA preparations, DNA
sequencing and sequence analysis were performed at CUGI
(Wing, Yu, Frisch, Henry, Simmons, Rambo, Main). The
sequence has been trimmed to remove vector sequence and
contains a minimum of 100 bases of phred value 20 or
above. For more details on library preparation and

excised from landa ZAP; Site_1: ECOR V: Site_2: ECOR V:
Host leukcoytes were extracted from P. vivax infected
blood using the following methods: first, infected blood
was activated by the addition of 0.5 ml of ADP (40mg/ml)
per 10 ml blood. Then blood was passed over a column of
acid washed ol.1 mm glass beads, then through a Plasmodipur
filter, followed by passage through a column of pre-wet
Mhatman CF11 powder (1:2 ratio volume of blood to CF11),
and finally contrifuged through a 50% percoll density
cushion. Purified DNA was digested with mung bean nuclease
in the presence of 44% formamide at 500C as described
(Vernick, K.D., Imberski, R.B., and McCucchan, T.F. 1998.
Nucleic Acids Research 16:6883-6896, Digested DNA was
blunt-ended using 74 DNA Polymerase and size fractionated
over a Sepharose CL-2B column. Fractions in the size range
500bp-4kb were ligated into the ECo RV site of pBluescript
SK(+), and E. coll XL-10 Gold transformed with the

Host leukocytes were extracted from P. vivax infected
blood using the following methods: first, infected blood
was activated by the addition of 0.5 ml of ADP (40mg/ml)
per 10 ml blood. Then blood was passed over a column of
acid washed o.1 mm glass beads, then through a Plasmodipur
filter, followed by passage through a column of pre-wet
Whatman CF11 powder (1:2 ratio volume of blood to CF11),
and finally centrifuede through a 50% Percoll density
cushion. Purified DNA was digested with mung bean nuclease
in the presence of 44% formamide at 50cC as described
(Vernick, K.D., Imberski, R.B., and McCutchan, T.F. 1988.
Nucleic Acids Research 16:6883:6896). Digested DNA was
blunt-ended using 14 DNA Polymerase and size fractionated
over a Sepharose CL-2B column. Fractions in the size range
500bp-4kb were ligated into the Eco RV site of pBluescript
SK(+), and E. coli. "All Gold transformed with the

                                                                                                                                                                                                                                                                             /db_xref="taxon.4558"
/clone_lib="pathogen induced 1 (PII)"
/clone_rogan: Anthraconose infected leaves from
two-week-old sorghum plants (BIX 623)
Site_2: ECORI: Two-week-old sorghum plants (BIX 623)
cultivar) were infected with pathogen (Isolate FRW42I of
Colletotrichum grammincola, which is a sorghum isolate).
RNA was prepared from infected leaves harvested from 45
seedlings (2 weeks old) exhibit juvenile resistant
reaction, which is an incompatible interaction. As they
grow older (4 weeks or older), plants resume susceptiblity
to anthraconose disease. The library was made from poly-A
RNA in the cloning vector lambda ZAP II. Clones to be
sequenced were prepared by mass excision. WARNING: While
most or all ESTs are expected to derive from the host
the pathogen."

RescueMu is a 4.9 kb, modified maize Mu transposon pBlueScript backbone); Site_l: BamHI; Site_2: BglI;
RescueMu is a 4.9 kb, modified maize Mu transposon designed to allow plasmid rescue from notal genomic DNA.
Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site. Www.zmdb.iastate.edu' and follow the links for 'RescueMu' Grid G was grown at Stanford in 2000. DNA was extracted from leaf punches, double digested using BamHI and BglII, and ligated to form circular plasmids. DH10B cells were transformed and then screened on LB plates with amploillin."
   modified pBluescript KS(+) after bulk excision from Lambda FLC I."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 1. Application US/0913321

| Sequence 1. Application US/0913321
| Patent No. 625558
| GENERAL INFORMATION: | BAPELICANT: Haseloff, Phillip J. |
| APPLICANT: Haseloff, Phillip J. |
| APPLICANT: Hodge, Sarah |
| TITLE OF INVENTION: EMPROVEMENTS IN OR RELATING TO GENE |
| TITLE OF INVENTION: EMPRESSION |
| NUMBER OF SEQUENCES: 15 |
| CORRESPONDENCE ADDRESS: 16 |
| STREET: 1100 No. 6255584h Glebe Road, 8th Floor CITY: Arilington |
| STAFE: Vo.S. A. |
| COMUTRY: U.S. A. |
| COMUTRY: U.S. A. |
| COMPUTER: READABLE FORM: |
| MEDIUM TYPE: Floppy disk |
| COMPUTER: READABLE FORM: |
| COMPUTER: PATENTIN Release #1.0, Version #1.30 |
| CURRENT APPLICATION DATA: |
| APPLICATION NUMBER: US/09/133,321 |
| FILING DATE: 12-AUG-1998 |
| CLASSIFICATION NUMBER: GB 9603069.7 |
| FILING DATE: 14-FEB-196 |
| ATTORNEY AGENT INFORMATION: |
| APPLICATION NUMBER: 29,009 |
| REFERENCE/DOCKET NUMBER: 29,009 |
| REFERENCE/DOCKET NUMBER: 29,009 |
| REFERENCE/DOCKET NUMBER: 29,009 |
| TELEOPHONE: 770A: A16-AAOAO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Length 456;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Indels
                             MEDIUM COMPUTER: IBM PC COMPATIBLE
COMPUTER: IBM PC COMPATIBLE
CORPATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION DATA:
APPLICATION NUMBER: U24
ATTONEY/AGENT INFORMATION:
APTENDATE: 18-DEC-1997
CLASSIFICATION: 4.24
ATTONEY/AGENT INFORMATION:
REGISTRATION NUMBER: 31,392
REFERENCE/DOCKET NUMBER: 210121.422C2
RELEPHONE: (206) 622-4900
TELEPHONE: (206) 622-4900
TELEPHONE: (206) 622-4900
TELEPRATION FROM SEQUENCE CHARACTERISTICS:
LENGTH: 4.56 base pairs
LENGTH: 4.56 base pairs
TYPE: nucleic acid
STRANDEDNESS: single
TOPOLGY: linear
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match 72.4%; Score 15.2; DB 4; Best Local Similarity 85.0%; Pred.
